Adversarial examples : a challenge to tackle

What are adversarial examples ?

What are adversarial examples ?

A small video to begin with

Formal definition

For an input x , a classification function f , an adversarial perturbation δ :

maximize classifier misclassification
such that perturbation stays below a certain threshold

Formal definition

For an input x , a classification function f , an adversarial perturbation δ :

maximize

$$f(x) \neq f(x + \delta)$$

such that

$$\|\delta\|_p \leq \varepsilon$$

Why are adversarial examples important ?

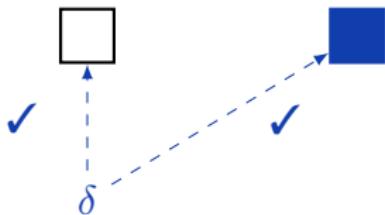

Adversarial examples :

- are transferable (Papernot et al., 2016, Transferability in Machine Learning..., Carlini et al. papers) ⇒ make ML more robust

Why are adversarial examples important ?

Adversarial examples :

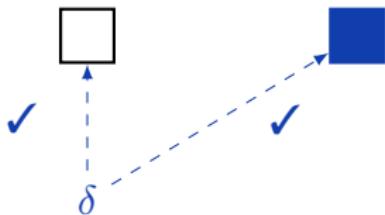

- are transferable (Papernot et al., 2016, Transferability in Machine Learning..., Carlini et al. papers) \Rightarrow make ML more robust

Why are adversarial examples important ?

Adversarial examples :

- are transferable (Papernot et al., 2016, Transferability in Machine Learning..., Carlini et al. papers) \Rightarrow make ML more robust

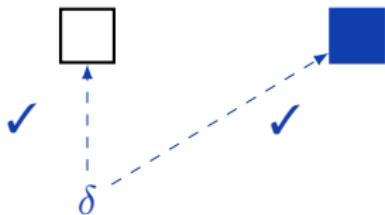

- not well understood (Goodfellow et al. 2018, Adversarial Spheres, Madry et al., 2018, Adversarial Examples are not bugs...) \Rightarrow design better ML algorithms

Why are adversarial examples important ?

Adversarial examples :

- are transferable (Papernot et al., 2016, Transferability in Machine Learning..., Carlini et al. papers) \Rightarrow make ML more robust

- not well understood (Goodfellow et al. 2018, Adversarial Spheres, Madry et al., 2018, Adversarial Examples are not bugs...) \Rightarrow design better ML algorithms
- provide us a *specification* to verify against \Rightarrow formal methods (later on my thesis, tomorrow at ForMaL)

Neural Ordinary Differentials Equations

Why do we bother about new architectures ?

- evaluation of new architecture designs robustness ⇒ test state of the art attacks

Why do we bother about new architectures ?

- evaluation of new architecture designs robustness ⇒ test state of the art attacks

Why do we bother about new architectures ?

- evaluation of new architecture designs robustness \Rightarrow test state of the art attacks
- new vision on neural network computation \Rightarrow better intrinsic robustness properties ?

Why do we bother about new architectures ?

- evaluation of new architecture designs robustness ⇒ test state of the art attacks
- new vision on neural network computation ⇒ better intrinsic robustness properties ?
- new design could inspire us to invent new attacks and defenses ⇒ invariants as stability ?

What are ODE Nets ?

What are ODEs ?

Small recap on ODEs

Let $\mathbf{y} : \mathbf{x} \in \mathbb{R}^d \rightarrow \mathbf{y}(\mathbf{x}) \in \mathbb{R}^p$, differentiable, t time

An ordinary differential equation (ODE) is \mathbf{F} such that :

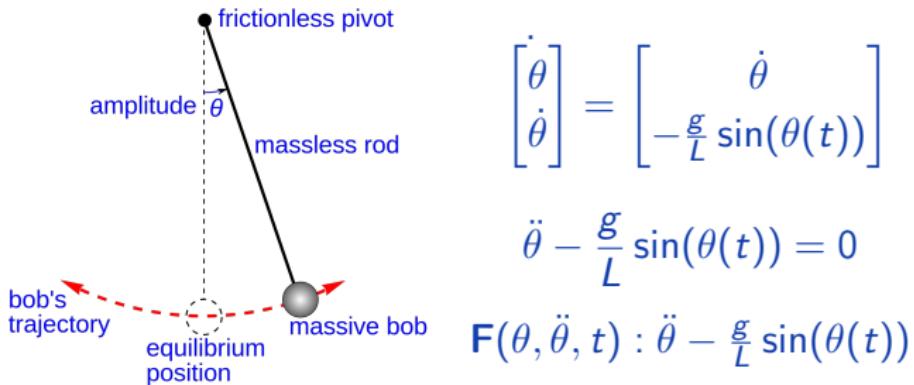

$$\mathbf{F}(\mathbf{x}, \mathbf{y}, \mathbf{y}^1, \mathbf{y}^2, \dots, \mathbf{y}^{(n)}, t) = 0$$

Small recap on ODEs

Let $\mathbf{y} : \mathbf{x} \in \mathbb{R}^d \rightarrow \mathbf{y}(\mathbf{x}) \in \mathbb{R}^p$, differentiable, t time

An ordinary differential equation (ODE) is \mathbf{F} such that :

$$\mathbf{F}(\mathbf{x}, \mathbf{y}, \mathbf{y}^1, \mathbf{y}^2, \dots, \mathbf{y}^{(n)}, t) = 0$$

How do we solve them

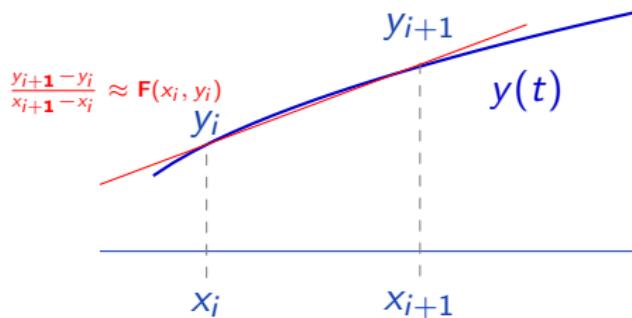

$$\ddot{y} - \epsilon * w * (1 - y^2) * \dot{y} + w^2 * y = 0$$

Van der Pol oscillator

No analytical solution in the general case \Rightarrow numeric approximations

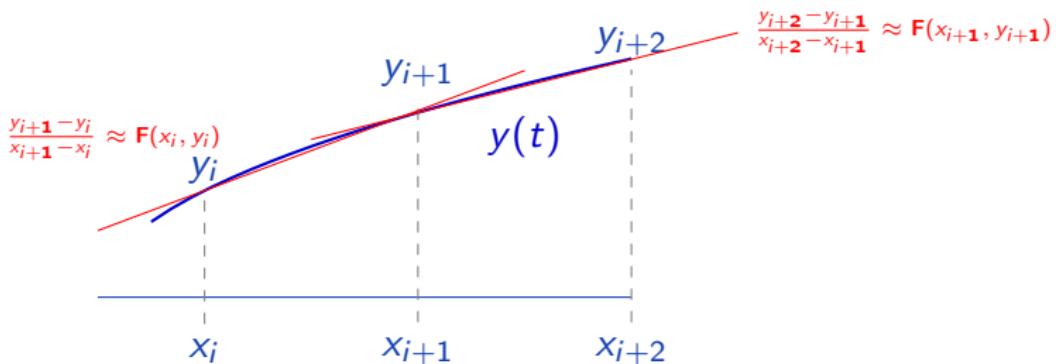

How do we solve them - continued

A simple numerical method : Euler method

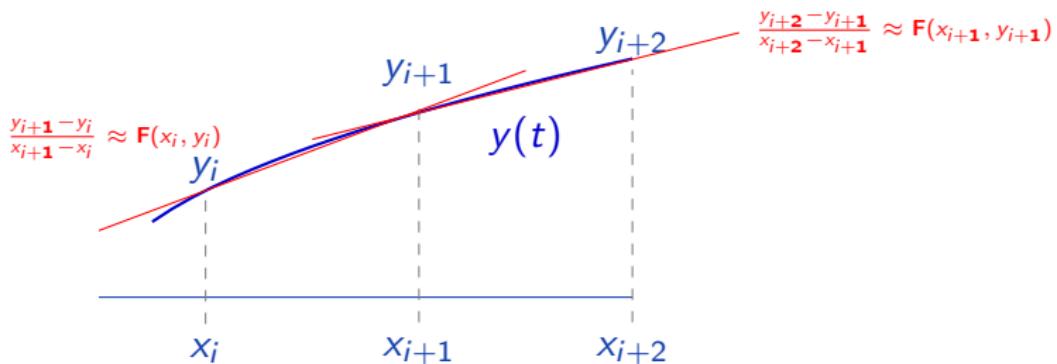

How do we solve them - continued

A simple numerical method : Euler method

How do we solve them - continued

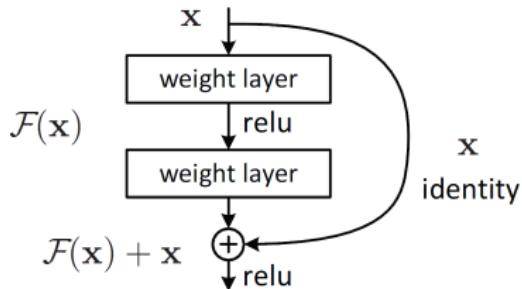

A simple numerical method : Euler method

Parameters :

- timesteps : accuracy vs speed
- for other solvers : multiple evaluations for increased stability
- error control

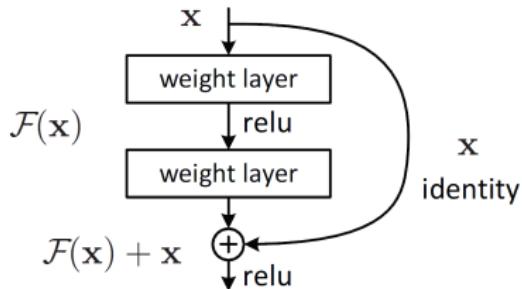

ODEs in neural networks ?

A skip connection (He et al.,
2015, Residual Deep Learning...)

$$h(x_i) = \mathcal{F}(x_i) + x_i : \text{state at a given point } i$$

ODEs in neural networks ?

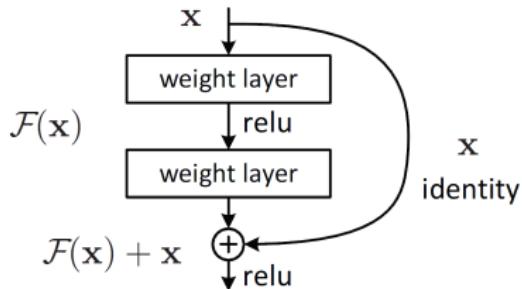

A skip connection (He et al., 2015, Residual Deep Learning...)

$$h(x_i) = \mathcal{F}(x_i) + x_i : \text{state at a given point } i$$

x_i is the result of previous computations $h(x_{i-1})$

ODEs in neural networks ?

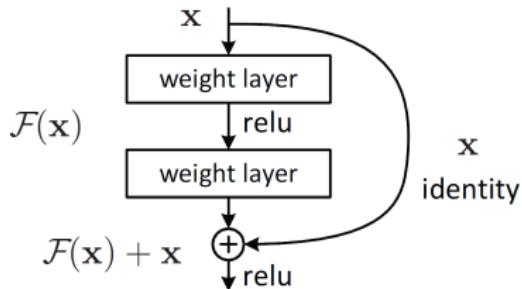

A skip connection (He et al.,
2015, Residual Deep Learning...)

$h(x_i) = \mathcal{F}(x_i) + h(x_{i-1})$: state at a given point i

x_i is the result of previous computations $h(x_{i-1})$

$$\frac{h(x_i) - h(x_{i-1})}{i+1-i} = \mathcal{F}(x_i)$$

ODEs in neural networks ?

A skip connection (He et al.,
2015, Residual Deep Learning...)

$h(x_i) = \mathcal{F}(x_i) + h(x_{i-1})$: state at a given point i

x_i is the result of previous computations $h(x_{i-1})$

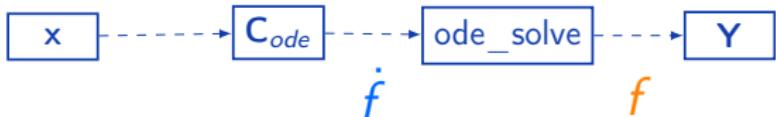

$$\frac{h(x_i) - h(x_{i-1})}{i+1-i} = \mathcal{F}(x_i)$$

$$\frac{y_{i+1} - y_i}{x_{i+1} - x_i} \approx \mathbf{F}(x_i, y_i)$$

Euler method !

Neural Ordinary Differential Equations

ODE Net pipeline

Classical pipeline

Interest in image classification : lower parameter footprint

Chen et al., 2018, Neural Ordinary Differential Equations

Case study

Threat model

Goal : assert the attack and defense perimeter

Threat model

Goal : assert the attack and defense perimeter

	White box	Black box
Access to the model's parameters	✓	✗
Access to the model's output	✓	limited
Access to the gradient	✓	✗
Knowledge of the defense	✓	✓
Perturbation characteristics	✓	✓

Assumptions on attacker's capabilities

The Big Questions

What makes a good attack ?

What makes a good defense ?

The Big Questions

What makes a good attack ?

Break robustness within the given threat model

What makes a good defense ?

The Big Questions

What makes a good attack ?

Break robustness within the given threat model

What makes a good defense ?

1. Provably increase robustness within the given threat model
2. Limits the attack surface

FGSM (Goodfellow et al., 2014)

$$\mathbf{x}' = \mathbf{x} + \varepsilon \underbrace{\text{sign}(\nabla_{\mathbf{x}} L(\theta, \mathbf{x}, \mathbf{y}))}_{\delta}$$

Idea : make a step towards the direction maximizing the loss

Projected Gradient Descent ℓ_∞ (Madry et al., 2017)

$\min_{\theta}(\rho(\theta))$, where $\rho(\theta) = E_{(x,y) \in D} [\max_{\delta \in D} (L(\theta, x + \delta, y))]$

$$x_{t+1} = \Pi(x + \delta)(x_t + \underbrace{\alpha \text{sign}(\nabla_x L(\theta, x, y))}_{\delta})$$

Multiples iterations, works because of the geometric landscape

Carlini-Wagner l_2 (Carlini et al., 2016)

maximize

classifier misclassification

such that

perturbation stays below a certain threshold

$$\min(c * \|\delta\|_p + J(x + \delta, l))$$

w.r.t.

$$x + \delta \in X$$

$$J(x, l) = \max((\max_{i \neq t}(\text{logits}(x)_i) - \text{logits}(x)_t), 0)$$

Carlini-Wagner l_2 (Carlini et al., 2016)

maximize $f(x) \neq f(x + \delta)$

such that $\|\delta\|_p \leq \varepsilon$

$$\min(c * \|\delta\|_p + J(x + \delta, l))$$

w.r.t.

$$x + \delta \in X$$

$$J(x, l) = \max((\max_{i \neq t}(\text{logits}(x)_i) - \text{logits}(x)_t), 0)$$

Results

ODE Nets are more vulnerable

	FGSM ($\varepsilon = 0.3$)	C&W	PGD ($\varepsilon = 0.3$)

Summary

1. ODE Nets are less robust than naturals comparable models
 - less parameters
 - perturbating the derivative is easier
2. Adversarial training is still efficient
3. Possible way to improve robustness
 - integration time
 - numerical stability (more robust numerical schemes, Lyapunov invariants, etc.)
